Reilly Brown
3/31/20

For this assignment we were instructed to use Blink Without Delay or MSTimer to create 'simultaneous' multiple outputs (and/or read multiple sensors (for example: apply 'Fading' to all 3 channels of an RGB LED)).

This assignment was not as difficult as I anticipated. I used the same hardware setup as the RGB LED assignment and then did some research on millis().

For my final product, my code switches between red, blue and green with intervals of 500 milliseconds in between.
